

BRAIN TRAINING

7-Day Brain Workout Starter Plan

Ten minutes a day. Real improvement in two weeks. Here's how to start the right way.

How this works

The brain responds to focused, varied training the same way muscles respond to varied workouts. You don't do bicep curls every day; you cycle through different exercises. Same logic for cognition: 7 days, 4 categories, building difficulty.

The 7-day schedule

Day 1 · Memory baseline

Open Brainova. Take the Brain Score test. Don't train, just measure. Write down your number.

Day 2 · Memory focus

10 minutes in the Memory category. Start with shorter patterns; build up. Aim to clear 5 rounds.

Day 3 · Mental math

10 minutes Speed Math. Quick equations, multiple choice. Don't worry about wrong answers — speed comes from familiarity.

Day 4 · Mixed session

5 min Memory + 5 min Math. The category-switch is part of the workout — context-switching is its own skill.

Day 5 · Attention

10 minutes Attention drills. The "tap green, ignore red" type. Don't multitask, this only works with full focus.

Day 6 · Logic

10 minutes Logic puzzles. Connect-the-dots, path-finding, sequence completion. This is where IQ-style training lives.

Day 7 · Retest

Take the Brain Score test again. Compare to Day 1. Most people gain 5-15 points in their first week.

3 APPS · BUILT FOR IPHONE

THE 3 HABITS

That double your improvement rate

Same time, every day

The brain locks in routines. If you train at 8 AM with coffee, train at 8 AM every day. You stop thinking about whether to do it. The session just happens.

Quality over quantity

10 focused minutes beats 30 distracted minutes. Phone on Do Not Disturb. No music with lyrics. Don't mix in social-media checks.

Track the Brain Score weekly, not daily

Daily score has noise (sleep, stress, hydration). Compare your Week 1 score to Week 4. That trend is the real signal.

What to expect

Week 1: Mostly familiarisation. Score may dip slightly as you tackle real difficulty.

Week 2: First real gains, especially in Memory and Math.

Week 3: Attention starts catching up. You'll notice it at work too.

Week 4+: Compound effect. Most users settle 15-25 points above their starting baseline.
