

MEASUREMENT CHECKLIST

Furniture Measurement Checklist

Before any IKEA, Wayfair, Home Depot or Pottery Barn trip — measure these.

Why measure first

Wrong-size furniture returns cost an average of \$80-150 per item. Renovation rework when measurements are off: \$400-900. Five minutes with 3D Tape Measure prevents all of it.

The 9 measurements you must check

01 · Room width (longest wall)

Use Line mode. The wall that determines major furniture placement.

02 · Room depth

Perpendicular to width. Together they give you total floor area.

03 · Ceiling height

Crucial for tall items: bookshelves, wardrobes, headboards.

04 · Floor area (Polygon mode)

For L-shaped or irregular rooms. Gives total area instantly.

05 · Door width (clear opening)

Will the sofa fit through? Measure inside-edge to inside-edge of the frame.

06 · Hallway width

Narrowest point along the path from front door to room.

07 · Elevator dimensions

If you're above ground floor — width, depth, diagonal.

08 · Window width and height

For curtains, blinds, and to know where to NOT place furniture.

09 · Power outlet positions

Note distance from corners. Saves you from buying a TV stand that blocks the only socket.

THE WORKFLOW

5 minutes, project saved, no errors

1. Open 3D Tape Measure and create a new project

Name it after the room (e.g., "Living Room — Sept").

2. Walk the room and measure all 9 items above

Use Line for distances, Rectangle for surfaces, Polygon for the floor.

3. Export as PDF

You now have a one-page reference you can show to a salesperson or contractor.

4. Take the PDF to the store

No more guessing. No more wrong-size returns.

5. Keep the project file

Reuse it for the next purchase. Replace measurements if you renovate later.

The "Will it fit through?" math

A common trap: the item fits the room but won't fit through the door. For doorways, the rule is: sofa depth + an extra 5-10 cm clearance should be less than door width. For diagonal carry-in (when you have to angle furniture through), use the formula: $\text{diagonal length} = \sqrt{(\text{length}^2 + \text{depth}^2)}$. 3D Tape Measure does this automatically when you switch to Rectangle mode.
